

Dexo SaaS Architecture Migration Plan (Revised)

Use apps/platform and apps/platform-admin as canonical names. Avoid business-specific app folders.

Standard ports: 3001 Platform, 3002 Platform Admin, 4000 API, 4005 Tenant Website, 4006 Tenant Admin, 4007 Customer Portal, 8081 Mobile.

Resolve tenants via hostname middleware rather than App Router [subdomain] folders. Do not use app/[subdomain] routes.

Support multiple industries by introducing BusinessType and pluggable modules (fitness, restaurant, spa, tailor, hotel, etc.).

Keep one Tenant Admin, one Tenant Website, and one Customer Portal. Load navigation, workflows, permissions, and pages dynamically from enabled modules.

Use Next.js App Router only. New routes belong under app/, APIs under app/api/route.ts where possible. Use next/navigation, layouts, Server Components by default, 'use client' only when needed.

Execution order: rename apps, update workspace and scripts, migrate schema (tenantId on ContactMessage), scope APIs by tenant, build tenant apps, then migrate legacy routes and remove duplicates.

Adopt shared packages: auth, tenancy, permissions, ui, api-client, billing, notifications, cms, analytics. Put industry-specific logic under modules/.

Add middleware-based tenant resolution, feature flags, branding loader, role-based navigation, audit logging, centralized configuration, environment validation, health checks, CI, testing, and documentation as engineering standards.
